

Restaurant Management System (RMS)

Report

Restaurant Management System (RMS)

For M-Restaurant (Ethiopian Traditional Cuisine)

Student Name: Muhammedareb Ahmed

UGR Number: UGR/73591/16

Supported Languages: English, Amharic, Arabic, Afan Oromo

1. Introduction

Restaurants are important social and cultural centers in Ethiopia. Traditional foods such as Injera, Doro Wot, Tibs, Kitfo, Shiro, and Chechebsa represent Ethiopian cultural identity. M-Restaurant aims to preserve this heritage, but currently uses manual systems for order and menu management. These systems cause slow service, errors, poor record keeping, and language barriers. A Multilingual Restaurant Management System (RMS) is proposed to automate operations and support multiple languages.

2. Problem Statement

M-Restaurant faces challenges such as manual order processing, long waiting times, lack of a centralized database, inaccurate sales records, weak data security, and communication problems caused by language differences.

3. Objectives

General Objective

To design and develop a Multilingual RMS that improves restaurant efficiency and service quality.

Specific Objectives

- Develop secure login and user management
- Manage Ethiopian traditional menus

- Support four languages
 - Enable order placement and tracking
 - Store data securely and reduce errors
-

4. Scope and Limitations

The system covers menu management, order processing, user authentication, and multilingual support. It is limited to one restaurant branch, excludes online payment, and is web-based only.

5. Significance of the Study

The system improves efficiency, reduces human error, enhances customer satisfaction, and provides accurate records. Academically, it helps students understand real-world system development.

6. System Overview

The system has two users: Admin and Customer. It provides secure login, multilingual menus, order management, and reliable database storage with good performance and usability.

7. Methodology and Tools

The Waterfall Model is used. Technologies include PHP, MySQL, HTML, CSS, JavaScript, and Apache (XAMPP).

8. Conclusion

The proposed Multilingual RMS modernizes M-Restaurant operations while preserving Ethiopian food culture. It improves efficiency, reduces language barriers, and enhances customer satisfaction.
